

ES8218E

Low Power Audio ADC

FEATURES

System

- High performance and low power multi-bit delta-sigma audio ADC
- I²S/PCM master or slave serial data port
- Two pairs of analog input with differential input option
- 256/384Fs and USB 12/24 MHz system clocks
- Fast power up time
- I²C interface

ADC

- 24-bit, 8 to 96 kHz sampling frequency
- 96 dB signal to noise ratio, -85 dB THD+N
- Low noise pre-amplifier
- Auto level control (ALC) and noise gate
- High PSRR
- Shelving filter to compensate mic frequency response
- Support digital mic

Low Power

- 1.8V to 3.3V operation
- 9 mW record
- Low standby current

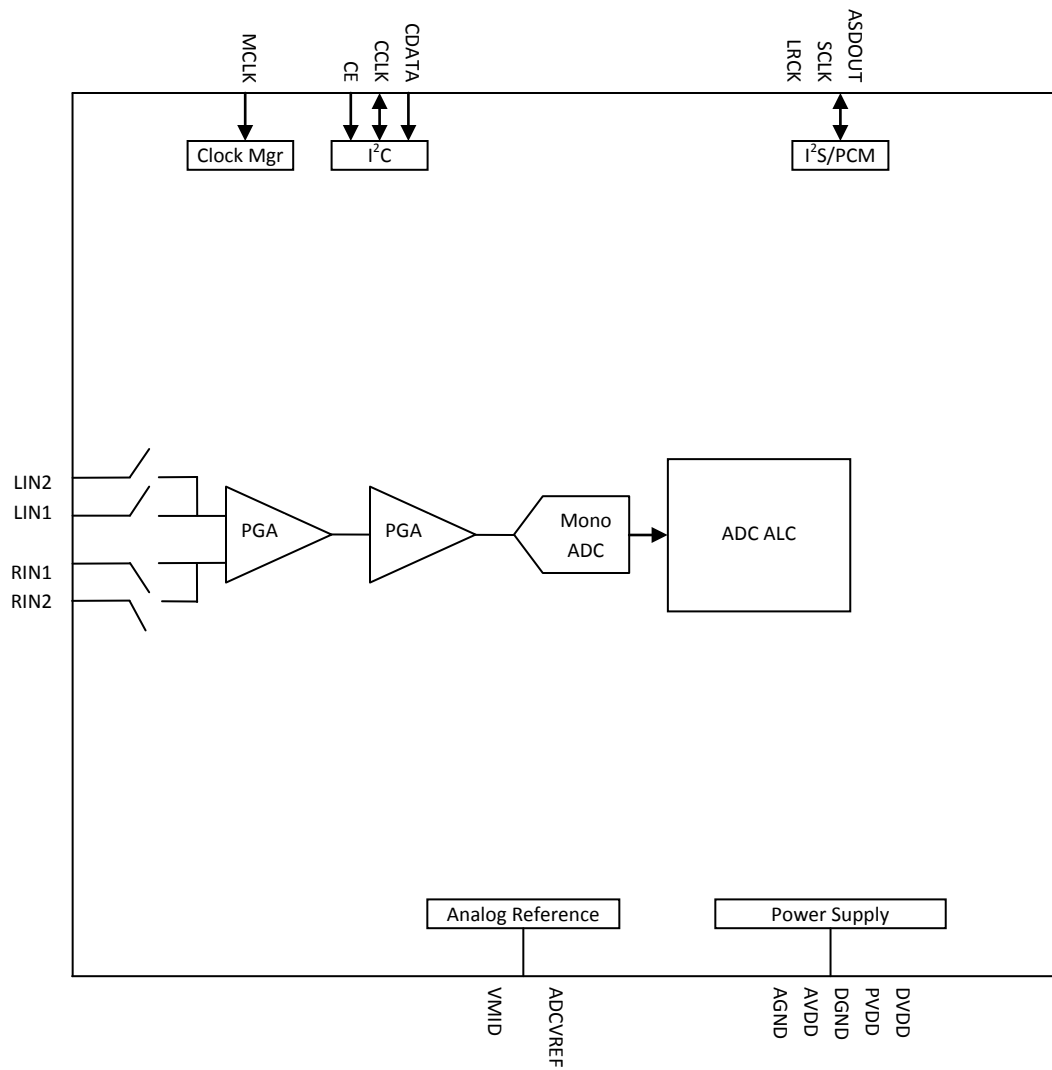

APPLICATIONS

- Wireless remote
- Portable audio

3. TYPICAL APPLICATION CIRCUIT

4. CLOCK MODES AND SAMPLING FREQUENCIES

The device supports two types of clocking: standard audio clocks (256Fs, 384Fs, 512Fs, etc), and USB clocks (12/24 MHz).

According to the serial audio data sampling frequency (F_s), the device can work in two speed modes: single speed mode or double speed mode. In single speed mode, F_s normally ranges from 8 kHz to 48 kHz, and in double speed mode, F_s normally range from 64 kHz to 96 kHz.

The device can work either in master clock mode or slave clock mode. In slave mode, LRCK and SCLK are supplied externally, and LRCK and SCLK must be synchronously derived from the system clock with specific rates. In master mode, LRCK and SCLK are derived internally from device master clock.

5. MICRO-CONTROLLER CONFIGURATION INTERFACE

The device supports standard I²C micro-controller configuration interface. External micro-controller can completely configure the device through writing to internal configuration registers.

I²C interface is a bi-directional serial bus that uses a serial data line (SDA) and a serial clock line (SCL) for data transfer. The timing diagram for data transfer of this interface is given in Figure 1. Data are transmitted synchronously to SCL clock on the SDA line on a byte-by-byte basis. Each bit in a byte is sampled during SCL high with MSB bit being transmitted firstly. Each transferred byte is followed by an acknowledge bit from receiver to pull the SDA low. The transfer rate of this interface can be up to 100 kbps.

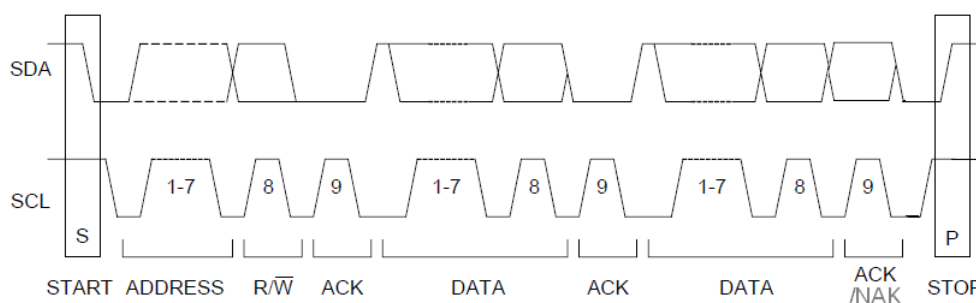

Figure 1 Data Transfer for I²C Interface

A master controller initiates the transmission by sending a “start” signal, which is defined as a high-to-low transition at SDA while SCL is high. The first byte transferred is the slave address. It is a seven-bit chip address followed by a RW bit. The chip address must be 001000x, where x equals ADO. The RW bit indicates the slave data transfer direction. Once an acknowledge bit is received, the data transfer starts to proceed on a byte-by-byte basis in the direction specified by the RW bit. The master can terminate the communication by generating a “stop” signal, which is defined as a low-to-high transition at SDA while SCL is high.

In I²C interface mode, the registers can be written and read. The formats of “write” and “read” instructions are shown in Table 1 and Table 2. Please note that, to read data from a register, you must set R/W bit to 0 to access the register address and then set R/W to 1 to read data from the register.

Table 1 Write Data to Register in I²C Interface Mode

Chip Address		R/W		Register Address		Data to be written
001000	AD0	0	ACK	RAM	ACK	DATA

Table 2 Read Data from Register in I²C Interface Mode

Chip Address		R/W		Register Address
001000	AD0	0	ACK	RAM
Chip Address		R/W		Data to be read
001000	AD0	1	ACK	Data

6. DIGITAL AUDIO INTERFACE

The device provides many formats of serial audio data interface to the output from the ADC through LRCK, BCLK (SCLK) and ADCDAT pins. These formats are I²S, left justified and DSP/PCM mode. ADC data is out at ADCDAT on the falling edge of SCLK. The relationships of SDATA (ADCDAT), SCLK and LRCK with these formats are shown through Figure 2 to Figure 6.
